---

---

---

---

---

---

---

## Objectives

- Introduce the definition and characteristics of embedded systems
- Discuss the main requirements of an embedded system
- Analyze two classes of embedded systems
  - *Real Time* Embedded Systems
  - *Distributed* Embedded Systems

Embedded Systems 2 Operating Systems

---

---

---

---

---

---

---

---

## Overview

- Basic Concepts
- Main Requirements
- *Real Time* Embedded Systems
- *Distributed* Embedded Systems

Embedded Systems 3 Operating Systems

---

---

---

---

---

---

---

---

**Definizione**

- Sistema informatico *dedicato*, progettato cioè per svolgere un compito *preciso* e *determinato*
- *Embedded*: tali sistemi sono parte integrante di sistemi più grandi
  - compiti di controllo, elaborazione, memorizzazione ...
- Il PC è un sistema general purpose
  - Può essere utilizzato per realizzare sistemi embedded.
  - Include diversi sistemi embedded (disco, CD, scheda video, ...).

Embedded Systems 4 Operating Systems

---

---

---

---

---

---

---

---

**Are di applicazione**

- Acquisizione dati ed elaborazione
- Comunicazioni
- Sistemi di controllo digitale
- Robotica
- Interfacce
- Unità ausiliari:
  - Display
  - Dischi
  - Monitoraggio e protezione di sistemi
  - Test e diagnosi di sistemi

Embedded Systems 5 Operating Systems

---

---

---

---

---

---

---

---

**Solo alcuni esempi**

Embedded Systems 6 Operating Systems

---

---

---

---

---

---

---

---

 **Caratteristiche** 

- Specializzazione e ottimizzazione
  - Con riferimento all'applicazione svolta
- Inclusione di elettronica ed altri dispositivi dedicati per
  - Interagire con il mondo esterno
  - Svolgere alcune funzioni elaborative
- Possono avere vincoli Real-time
- Possono essere sistemi distribuiti
  - O parte di un sistema distribuito

Embedded Systems Operating Systems

---

---

---

---

---

---

---

---

 **Specializzazione** 

- Un sistema embedded è progettato per eseguire una sola applicazione (o poche applicazioni)
  - Le applicazioni da svolgere sono note a priori, prima che il processo di progettazione inizi
- Futuri aggiornamenti
  - flessibilità per i futuri aggiornamenti o per un eventuale riutilizzo del componente.
  - si raggiunge questo scopo rendendo il sistema riprogrammabile

Embedded Systems Operating Systems

---

---

---

---

---

---

---

---

 **Hardware dedicato** 

- Interazione col mondo esterno analogico
  - Necessità di campionare, memorizzare, e trasmettere segnali.
    - ▶ *Sensori*
    - ▶ *Attuatori*
    - ▶ *Convertitori A/D e D/A*
- Interazione con l'utente
  - Avviene con mezzi spesso limitati
    - ▶ *Display di dimensione ridotta*
    - ▶ *Dispositivi di input limitati*
    - ▶ *Dispositivi di I/O specializzati rispetto alle competenze o al modo di operare dell'utente*

Embedded Systems Operating Systems

---

---

---

---

---

---

---

---

 **Applicazioni Real Time** 

- Un sistema real-time esegue dei task con vincoli temporali
- Sistemi Hard real-time vs. Soft real-time
- I sistemi Hard real-time molto spesso sono dei sistemi embedded

Embedded Systems 10 Operating Systems

---

---

---

---

---

---

---

---

 **Sistemi Embedded Distribuiti** 

- Composti da più sottosistemi che cooperano nello svolgimento di un servizio
- Vantaggi:
  - Localizzazione dell'elaborazione
    - ▶ il lavoro è fatto dove serve
  - Specializzazione dell'elaborazione
    - ▶ il lavoro è fatto da chi lo sa fare meglio
  - Ridondanza
    - ▶ possibilità di supplire a guasti parziali
- Svantaggi
  - Necessità di coordinamento e comunicazione fra i vari sottosistemi
  - Aumento della complessità

Embedded Systems 11 Operating Systems

---

---

---

---

---

---

---

---

 **Overview** 

- Basic Concepts
- **Main Requirements**
- *Real Time* Embedded Systems
- *Distributed* Embedded Systems

Embedded Systems 12 Operating Systems

---

---

---

---

---

---

---

---

 **Principali requisiti** 

- Requisiti funzionali
- Requisiti temporali
- Requisiti di affidabilità
- Consumo
- Prestazioni
- Costo

Spesso i requisiti risultano in contrasto tra loro!

Embedded Systems 13 Operating Systems

---

---

---

---

---

---

---

---

---

---

 **Requisiti funzionali** 

- Contengono la specifica della parte elaborativa del sistema
  - Definiscono quali sono i dati di ingresso e da dove provengono (sensori, utente umano, ...)
  - Definiscono quali sono i dati di uscita e a chi devono essere inviati (attuatori, utente umano, ...)
  - Definiscono le relazioni che esistono fra dati di ingresso e di uscita
    - *quali dati di uscita devono essere prodotti dal sistema in funzione dei dati di ingresso*

Embedded Systems 14 Operating Systems

---

---

---

---

---

---

---

---

---

---

 **Requisiti temporali** 

- I task possono avere deadline
- Requisiti temporali derivanti dall'esecuzione di task periodici
- Latenza nella risposta
- Latenza nella rilevazione degli errori
- Interazione con l'uomo

Embedded Systems 15 Operating Systems

---

---

---

---

---

---

---

---

---

---

 **Requisiti di affidabilità** 

- **Affidabilità**
  - Il sistema deve presentare un *MTTF (Mean-Time-To-Failure)* sufficientemente alto
- **Sicurezza (Safety)**
  - Gestione di particolari casi critici
  - Certificazione (obbligatoria in alcuni settori quali il settore spazio, aviazione ed il settore militare)
- **Riparabilità**
  - *MTTR (Mean-Time-To-Repair)* sufficientemente basso
- **Disponibilità**
  - $D = \text{MTTF} / (\text{MTTF} + \text{MTTR})$

Embedded Systems 16 Operating Systems

---

---

---

---

---

---

---

---

 **Consumo** 

- Il consumo è uno dei *requirements* principali
  - Influisce sulla complessità dell'hardware
    - alimentatori, batterie, sistemi di raffreddamento
  - E anche sul costo complessivo
- In sistemi alimentati a batteria è fondamentale
  - Maggiore autonomia (batterie ricaricabili)
  - Maggiore tempo di vita (batterie non ricaricabili)
- Il consumo influisce sulla dissipazione del calore
  - e del rumore (es. ventole)

Embedded Systems 17 Operating Systems

---

---

---

---

---

---

---

---

 **Prestazioni** 

- **Migliori prestazioni →**
  - ☺ si soddisfano più facilmente i requisiti temporali
  - ☺ si aumenta l'usabilità del sistema stesso
  - ☹ si aumenta il consumo del sistema
- È possibile variare dinamicamente le prestazioni per controllare il consumo
- Le prestazioni influenzano il costo finale del dispositivo

Embedded Systems 18 Operating Systems

---

---

---

---

---

---

---

---

 **Costo** 

- Per sistemi prodotti in larga scala il costo finale è un aspetto fondamentale.
- È profondamente legato alle scelte di progetto,
  - Scelta dell'architettura (distribuita, centralizzata, ...)
  - Hardware (tipo di CPU, tipo e quantità di memoria, periferiche di I/O)
  - Software (costi di progettazione e di sviluppo)
  - Licenze e diritti per HW e SW (librerie, ambienti di sviluppo, compilatori, ambienti di testing)
  - Numero di pezzi prodotti

Embedded Systems 19 Operating Systems

---

---

---

---

---

---

---

---

 **Overview** 

- Basic Concepts
- Main Requirements
- **Real Time (Embedded) Systems**
- *Distributed* Embedded Systems

Embedded Systems 20 Operating Systems

---

---

---

---

---

---

---

---

 **Features of Real-Time Kernels** 

- Most real-time systems do not provide the features found in a standard desktop system
- Reasons include
  - Real-time systems are typically single-purpose
  - Real-time systems often do not require interfacing with a user
  - Features found in a desktop PC require more substantial hardware than what is typically available in a real-time system

Embedded Systems 21 Operating Systems

---

---

---

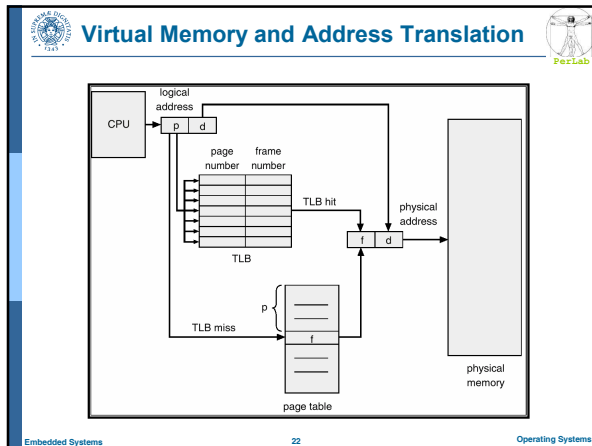

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

- ### Virtual Memory in Real-Time Systems
- Address translation may occur via:
    - Real-addressing mode where programs generate actual addresses
    - Relocation register mode
    - Implementing full virtual memory
- Embedded Systems 23 Operating Systems

---

---

---

---

---

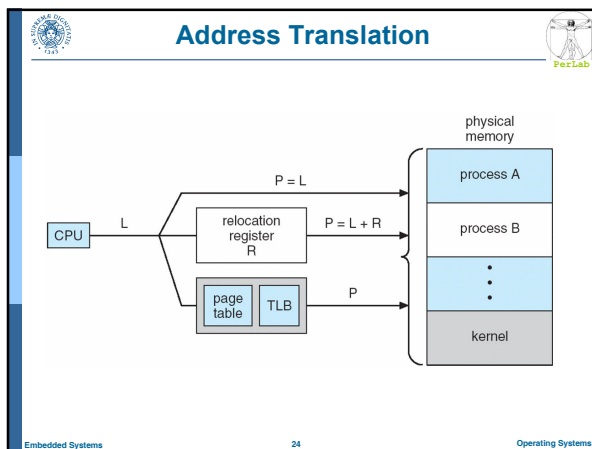

---

---

---

---

---

---

---

---

---

---

---

---

---

---

---

## Implementing Real-Time Systems

- In general, real-time operating systems must provide:
  - (1) Preemptive, priority-based scheduling
  - (2) Preemptive kernels
  - (3) Latency must be minimized

---

---

---

---

---

---

---

---

## Minimizing Latency

- **Event latency** is the amount of time from when an event occurs to when it is serviced.

---

---

---

---

---

---

---

---

## Interrupt Latency

- Period of time from when an interrupt arrives at the CPU to when it is serviced

---

---

---

---

---

---

---

---

## Dispatch Latency

- Amount of time required for the scheduler to stop one process and start another

The diagram illustrates the components of dispatch latency on a timeline. It starts with an 'event' occurring. This is followed by 'interrupt processing'. Once the 'process made available', there is a period of 'conflicts' before the 'dispatch' occurs. The time from the event to the start of 'real-time process execution' is the 'response interval'. The time from the start of 'real-time process execution' to the 'response to event' is the 'dispatch latency'.

time

Embedded Systems 28 Operating Systems

---

---

---

---

---

---

---

---

## Real-Time CPU Scheduling

- Periodic processes require the CPU at specified intervals (periods)
- $p$  is the duration of the period
- $d$  is the deadline by when the process must be serviced
- $t$  is the processing time

The diagram shows three consecutive periods labeled Period<sub>1</sub>, Period<sub>2</sub>, and Period<sub>3</sub>. Each period has a duration  $p$ . Within each period, there is a deadline  $d$  and a processing time  $t$  represented by a shaded bar. The processing time  $t$  must occur before the deadline  $d$  within each period.

Time

Embedded Systems 29 Operating Systems

---

---

---

---

---

---

---

---

## Real-Time CPU Scheduling

P1:  $p=50$  ms,  $t=20$  ms  $t/p=0.4$   
P2:  $p=100$  ms  $t=35$  ms  $t/p=0.35$

Scheduling of tasks when P2 has a higher priority than P1

The diagram shows a timeline from 0 to 120. Task P<sub>2</sub> (shaded bar) starts at 0 and ends at 35. Task P<sub>1</sub> (blue bar) starts at 35 and ends at 55. A deadline for P<sub>1</sub> is marked at 50. A combined deadline for P<sub>1</sub> and P<sub>2</sub> is marked at 100.

Deadlines

Embedded Systems 30 Operating Systems

---

---

---

---

---

---

---

---

## Rate Monotonic Scheduling

- A priority is assigned based on the inverse of its period
- Shorter periods = higher priority;
- Longer periods = lower priority
- $P_1$  is assigned a higher priority than  $P_2$ .

Deadlines:  $P_1$ ,  $P_1, P_2$ ,  $P_1$ ,  $P_1, P_2$

0 10 20 30 40 50 60 70 80 90 100 110 120 130 140 150 160 170 180 190 200

Embedded Systems 31 Operating Systems

---

---

---

---

---

---

---

---

---

---

## Rate Monotonic Scheduling

### Missed Deadlines with Rate Monotonic Scheduling

P1:  $p=50$  ms,  $t=25$  ms  $t/p=0.50$   
P2:  $p=80$  ms  $t=35$  ms  $t/p=0.44$

Deadlines:  $P_1$ ,  $P_2$ ,  $P_1$ ,  $P_1, P_2$

0 10 20 30 40 50 60 70 80 90 100 110 120 130 140 150 160

Maximum utilization:  $2(2^{1/n}-1)$   
•  $n=2$ : 0.83

Embedded Systems 32 Operating Systems

---

---

---

---

---

---

---

---

---

---

## Earliest Deadline First Scheduling

- Priorities are assigned according to deadlines:
  - the earlier the deadline, the higher the priority;
  - the later the deadline, the lower the priority

P1:  $p=50$  ms,  $t=25$  ms  $t/p=0.50$   
P2:  $p=80$  ms  $t=35$  ms  $t/p=0.44$

Deadlines:  $P_1$ ,  $P_2$ ,  $P_1$ ,  $P_1, P_2$

0 10 20 30 40 50 60 70 80 90 100 110 120 130 140 150 160

Embedded Systems 33 Operating Systems

---

---

---

---

---

---

---

---

---

---

 **Proportional Share Scheduling** 

- $T$  shares are allocated among all processes in the system
- An application receives  $N$  shares where  $N < T$
- This ensures each application will receive  $N/T$  of the total processor time

Embedded Systems 34 Operating Systems

---

---

- **Distributed Embedded Systems**
  - Wireless Sensor Networks

Embedded Systems 35 Operating Systems

---

---

---

---

---

---

---

---

 **Distributed Embedded System** 

- Several subsystems connected through communication links
- Data processing and storage are carried out cooperatively
- Classification based on communication
  - Wired
    - ▶ Automotive, intelligent home, ...
  - Wireless
    - ▶ Environmental monitoring, health care,
    - ▶ Wireless Sensor Networks (Networked Embedded Systems)

Embedded Systems 36 Operating Systems

---

---

---

---

---

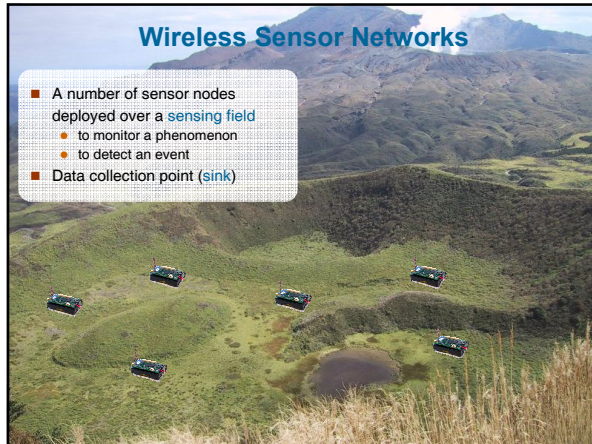

---

---

---

## Wireless Sensor Networks

- A number of sensor nodes deployed over a **sensing field**
  - to monitor a phenomenon
  - to detect an event
- Data collection point (**sink**)

---

---

---

---

---

---

---

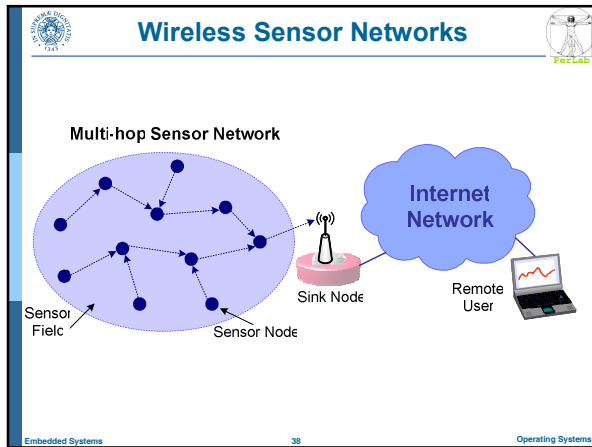

---

---

---

---

---

---

---

---

---

---

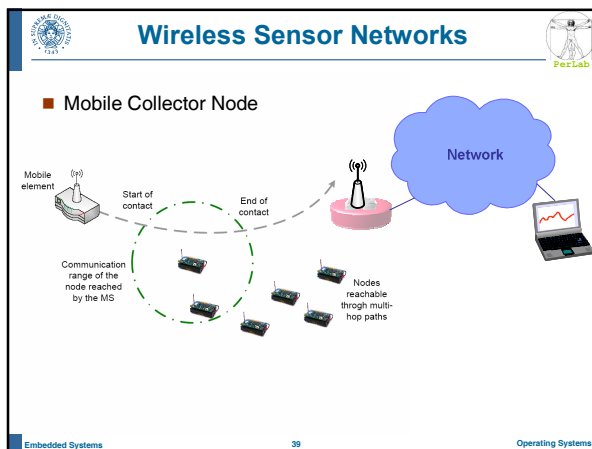

---

---

---

- ### Potential Application Areas
- Military Applications
  - Environmental Monitoring
  - Precision Agriculture
  - Health Monitoring
  - Intelligent Home
  - Info-mobility
  - Industrial applications
  - ...
- Embedded Systems 42 Operating Systems

---

---

---

---

---

---

---

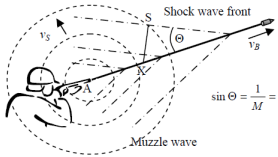

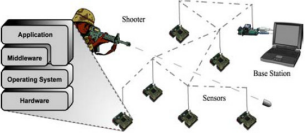

---

---

---

**Military Applications**

- **Monitoring**
  - friendly forces, equipment, ammunition
- **Battlefield surveillance**
- **Reconnaissance of opposite forces**
  - sniper detection
- **Targeting**
- **Battle damage assessment**
- **Attack detection**
  - nuclear, biological, chemical

Embedded Systems 43 Operating Systems

---

---

---

---

---

---

---

---

**Environmental Monitoring**

- **Alert systems**
  - forest fire detection
  - flood detection
  - seismic events
- **Flood detection**
  - deployment of different sensor types
    - rainfall sensors
    - water level sensors
    - weather sensors
  - sensors send information to a DB
  - flooding detection and prevention

Embedded Systems 44 Operating Systems

---

---

---

---

---

---

---

---

**Environmental Monitoring**

- **Tracking of animals' movements**
  - birds, insects...
- **Habitat Monitoring**
- **Great Duck Island Project**
  - monitoring of petrel habitat
  - sensors in petrel nests
    - temperature
    - humidity
    - light intensity
    - ...
  - monitoring of data before, during and after petrel permanency in nests

Embedded Systems 45 Operating Systems

---

---

---

---

---

---

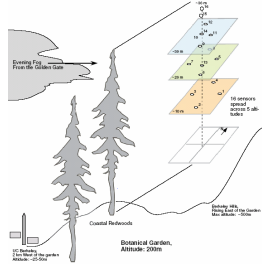

---

---

## Environmental Monitoring

- **Microclimate monitoring**
- **Berkeley botanical garden**
  - monitoring of environmental conditions around redwoods
  - 16 sensors deployed at different heights

Embedded Systems
46
Operating Systems

---

---

---

---

---

---

---

---

---

---

## Precision Agriculture

- **Temperature**
- **Humidity**
- **Wind Speed and Direction**
- **Soil moisture**

Embedded Systems
47
Operating Systems

---

---

---

---

---

---

---

---

---

---

## Health Applications

- **Remote monitoring**
  - physiological data
  - elderly people
    - fall detection
- **Hospital**
  - monitoring of patients
  - tracking of doctors and attendants
  - drug administration
    - minimize adverse drug events (allergies to a specific medicine)

Embedded Systems
48
Operating Systems

---

---

---

---

---

---

---

---

---

---

 **Home Applications** 

- **Smart Home**
  - sensors and actuators inside appliances
    - ovens
    - refrigerators
  - easy management of home devices (both local and remote)
- **Environmental control in buildings**
  - temperature and air flow control
  - light level control
  - Energy Efficiency

Embedded Systems 49 Operating Systems

---

---

---

---

---

---

---

---

 **Commercial Applications** 

- **Inventory Control**
  - each item has a sensor attached
  - easy localization of items
  - easy and smart management of items
- **Vehicle-related**
  - tracking and detection
  - car theft detection
  - remote monitoring of parking places

Embedded Systems 50 Operating Systems

---

---

---

---

---

---

---

---

 **Industrial Applications** 

- **Distributed Intelligent Sensing System for**
  - Factory automation
  - Process Control
  - Real-time monitoring of machinery's health
  - Detection of liquid/gas leakage
  - Remote monitoring of contaminated areas
  - Real time inventory management
  - ...

Embedded Systems 51 Operating Systems

---

---

---

---

---

---

---

---

**Industrial Applications**

Low, K.S. Win, W.N.N. Er, M.J., **Wireless Sensor Networks for Industrial Environments**, *Int'l Conference on Computational Intelligence for Modelling, Control and Automation*, 2005.

Embedded Systems 52 Operating Systems

---

---

---

---

---

---

---

---

**Current snapshot**

- Increasing number of sensor network deployments for real-life applications
- Progressive diffusion of commercial devices
  - sensors
  - sensor nodes

**WSNs cannot be regarded any more as an interesting research topic only**

Embedded Systems 53 Operating Systems

---

---

---

---

---

---

---

---

**Future perspectives**

ON World Inc., "Wireless Sensor Networks – Growing Markets, Accelerating Demands", July 2005 <http://www.onworld.com/html/wirelessensorsrprt2.htm>

- Prediction
  - 127 millions of sensor nodes operational in 2010
  - particularly in the field of industrial applications

Embedded Systems 54 Operating Systems

---

---

---

---

---

---

---

---

**Future perspectives**

Embedded WiSeNTs project (funded by the European Community, FP6) roadmap, Nov. 2006  
<http://www.embedded-wisents.org/dissemination/roadmap.html>

- Prediction
  - The WSN market share will grow considerably up to 2015
  - especially in the fields of logistics, automation and control

Embedded Systems 55 Operating Systems

---

---

---

---

---

---

---

---

---

---

---

---

**Platforms and Programming Issues**

Embedded Systems 56 Operating Systems

### The TinyOS operating system

- Specifically targeted to wireless sensor networks
  - a framework an application-specific operating system
  - static memory, low system overhead
- TinyOS application
  - task scheduler (FIFO, non-preemptive)
  - graph of components (how components are connected)
- Hardware abstractions

Embedded Systems 59 Operating Systems

---

---

---

---

---

---

---

---

---

---

### TinyOS computation model

- Component**
  - computing entity
    - interface (commands and events)
    - frame (private variables)
- Computing abstractions**
  - command**
    - service request to a component
    - non-blocking
  - event**
    - command completion, message or interrupt
  - task**
    - context of execution (~function)
    - run to completion, preemptor by event

Embedded Systems 60 Operating Systems

---

---

---

---

---

---

---

---

---

---

**TinyOS development environment**

- nesC language
  - extension to the C language
  - definition of interfaces
  - abstraction between definition and composition of components
- nesC compiler and OS source
  - composition of the component graph (at compilation time)
  - TinyOS computational model (additional checks)
- TOSSIM simulator
  - same code runs in actual nodes and simulator
  - flexible models for radio and sensors
  - scripting (Tython), graphical interface (TinyViz)

Embedded Systems 61 Operating Systems

---

---

---

---

---

---

---

---

---

---

---

---

**TinyViz**

Embedded Systems 62 Operating Systems

---

---

---

---

---

---

---

---

---

---

---

---

**Microserver-class Node: Stargate**

- Embedded platform from Intel
- Compute engine: PXA255 (32bit, 2.3 nJ/instruction, 200 MHz, 1.5V), several power management options
- Communication: built-on Bluetooth, 802.11 via PC or CF connector, and Mica2 or MicaZ mote via mote connector
- Software: Compaq bootloader, Linux 2.4 series kernel

Embedded Systems 63 Operating Systems

---

---

---

---

---

---

---

---

---

---

---

---

**Applications of Stargate-class nodes**

- Seismic monitoring
- Personal exploration rover
- Mobile micro-servers
- Networked info-mechanical systems
- Hierarchical wireless sensor networks

[Robotics, CMU]  
[NESL, UCLA]  
[NIMS, UCLA]  
[Intel + UCLA]

Embedded Systems [CENS, UCLA] 64 Operating Systems

---

---

---

---

---

---

---

---

**Networking Issues**

Embedded Systems 65 Operating Systems

---

---

---

---

---

---

---

---

**Features and Challenges**

- Application specific
  - protocols should adapt to the application behavior
- Environment interaction
  - The data traffic is expected to be different from human-driven traffic
- Scale
  - The number of sensor nodes can be several orders of magnitude higher than in traditional ad hoc networks
- Energy
  - Sensor nodes are limited in power, computational capabilities, and memory
  - Power sources cannot be replenished as in ad hoc networks

Embedded Systems 66 Operating Systems

---

---

---

---

---

---

---

---

**Features and Challenges**

- **Dependability**
  - sensor nodes **prone to failures**
  - **frequent topology changes** (due to failures, energy limitations, mobility)
- **Quality of Service (QoS)**
  - **heterogeneous**, strictly tied to data transfer type
- **Simplicity**
  - limited computational resources
- **Data-centric approach**
  - the importance of a particular node is considerably reduced (due to redundancy)

Embedded Systems 67 Operating Systems

---

---

---

---

---

---

---

---

---

---

**IEEE 802.15.4/ZigBee standard**

- **Standard for Personal Area Networks (PANs)**
  - low-rate and low-power
  - PHY and MAC layers
- **Main features**
  - transceiver management
  - channel access
  - PAN management

Embedded Systems 68 Operating Systems

---

---

---

---

---

---

---

---

---

---

**IEEE 802.15.4 and ZigBee**

- **IEEE 802.15.4 standard**
  - Low-rate, Low-power, Low-cost Personal Area Networks (PANs)
  - PHY and MAC layers
- **ZigBee Specifications**
  - Upper Layers

Embedded Systems 69 Operating Systems

---

---

---

---

---

---

---

---

---

---

**IEEE 802.15.4 components**

- Full Function Device (FFD)**
  - implements the full set of standard functionalities
  - PAN coordinator
  - coordinator
    - broadcasts beacons
    - clock synchronization
- Reduced Function Device (RFD)**
  - implements a minimal set of standard functionalities
  - cannot be a (PAN) coordinator
  - can only communicate with a FFD

Embedded Systems 70 Operating Systems

---

---

---

---

---

---

---

**IEEE 802.15.4: MAC protocol**

- Different operating conditions
  - duty-cycled beacon enabled mode
  - different channel access methods

```

graph TD
    MAC[MAC] --> NonBeacon[Non-beacon enabled]
    MAC --> Beacon[Beacon enabled  
Superframe Structure]
    NonBeacon --> ContentionBased1[Contention based  
Unslotted CSMA-CA]
    Beacon --> ContentionBased2[Contention based  
Slotted CSMA-CA]
    Beacon --> ContentionFree[Contention free  
Reserved time slot]
  
```

---

---

---

---

---

---

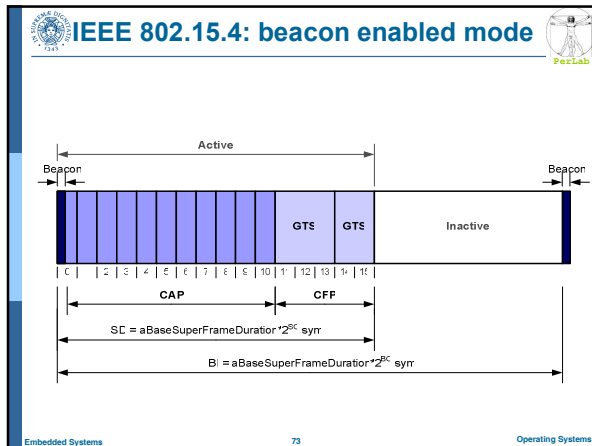

---

---

---

---

---

---

---

---

---

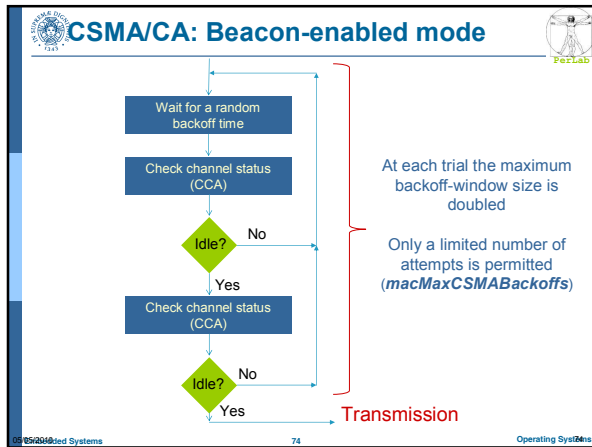

---

---

---

- ### Acknowledgement Mechanism
- Optional mechanism
  - Destination Side
    - ACK sent upon successful reception of a data frame
  - Sender side
    - Retransmission if ACK not (correctly) received within the timeout
    - At each retransmission attempt the maximum backoff window size is doubled
    - Only a maximum number of retransmissions allowed (*macMaxFrameRetries*)
- Embedded Systems 75 Operating Systems

---

---

---

---

---

---

---

---

---

---

**Single-hop Scenario**

PHY layer	2.4 GHz
Bit Rate	250 Kbps
Sensor nodes	from 1 to 50
Distance from Coordinator Node	10m
CS range	30m
RX range	15m
<b>Duty Cycle (<math>2^{*}SO/2^{*}BO</math>)</b>	<b>2%</b>
Traffic Generation	Periodic
Message Size	100 bytes
Messages per Beacon interval	1
Message Loss Rate	0-50%
Coordinator node always ON

## Key Question

---

# Why the 802.15.4 MAC Unreliability Problem Arises?

Embedded Systems
79
Operating Systems

---

---

---

---

---

---

---

---

## Causes and possible solutions

- The MAC unreliability problem is not intrinsic to the CSMA/CA algorithm
- It is originated by the default MAC parameter values
- The default parameter set is **not appropriate** for WSNs with power management enabled

Embedded Systems
80
Operating Systems

---

---

---

---

---

---

---

---

## CSMA/CA Parameter Values

Parameter	2003 release	2006 release	Notes
<i>macMaxFrameRetries</i>	3 <small>(aMaxFrameRetries)</small>	0+7 Default: 3	Max number of re-transmissions
<i>macMaxCSMABackoff</i>	0+5 Default: 4	0+5 Default: 4	Max number of backoff stages
<i>macMaxBE</i>	5 <small>(aMaxBE)</small>	3+8 Default: 5	Maximum Backoff Window Exp.
<i>macMinBE</i>	0+3 Default: 3	0+7 Default: 3	Minimum Backoff Window Exp.

Embedded Systems
81
Operating Systems

---

---

---

---

---

---

---

---

## Possible Solutions

- **DPS (Default Parameter Set)**
  - Set di parametri con i *valori di default* previsti dallo standard
- **SPS (Standard Parameter Set)**
  - Set di parametri con i *valori massimi* previsti dallo standard
- **NPS (Non-standard Parameter Set):**
  - Set di parametri con valori *oltre quelli consentiti* dallo standard

	macMinBE	macMaxBE	macMaxCSMABackoff	macMaxFrameRetries
DPS	3	5	4	3
SPS	7	8	5	7
NPS	8	10	10	10

---

---

---

---

---

---

---

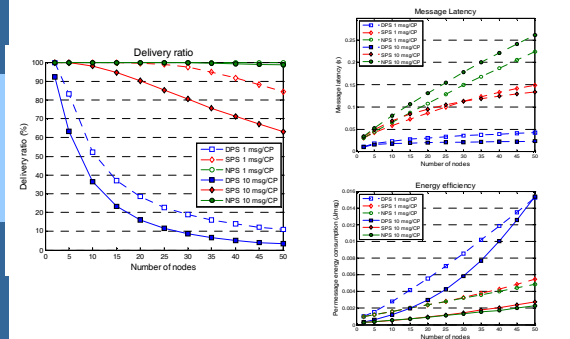

---

---

---

## Performance

---

---

---

---

---

---

---

---

---

---

## A Final Question

Are Simulation Results Reliable?

---

---

---

---

---

---

---

---

---

---

**Experimental Testbed**

Embedded Systems 85 Operating Systems

---

---

---

---

---

---

---

---

---

---

**Sensor Nodes**

■ T-mote Sky

- TinyOS Operating System
- IEEE 802.15.4 PHY
- IEEE TKN15.4 MAC (TU-Berlin)
- Power Management Enabled
- Periodic Reporting Applications

Embedded Systems 86 Operating Systems

---

---

---

---

---

---

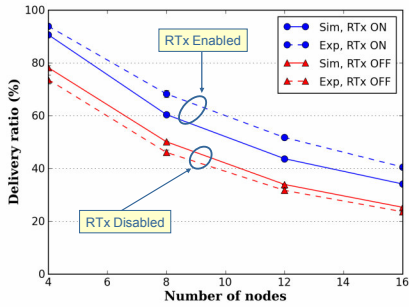

---

---

---

---

**Simulation vs. Experiments (Default values)**

Number of nodes	Sim, RTx ON (%)	Exp, RTx ON (%)	Sim, RTx OFF (%)	Exp, RTx OFF (%)
4	95	95	75	75
8	70	65	50	45
12	50	45	35	30
16	40	35	25	20

---

---

---

---

---

---

---

## Routing Protocols

Embedded Systems 91 Operating Systems

---

---

---

---

---

---

---

---

## Taxonomy of routing schemes

- Flat routing
  - No hierarchy
  - No global addressing
  - Queries on attribute-value (data-centric routing)
  - Flooding, gossiping, SPIN, Directed Diffusion, ...
- Hierarchical routing
  - Cluster/Tree-based organization
  - Suitable to data aggregation
  - LEACH, Mintroute, ...
- Location-based routing
  - Node location exploited
    - ▶ Absolute/Relative location information
    - ▶ Relative location information

Embedded Systems GAF, SPAN, ... 92 Operating Systems

---

---

---

---

---

---

---

---

## Flooding

- Each node that has received a packet re-transmits a copy to all – or parts – of its neighbors
- Interferences → collisions → re-transmissions
- High Energy consumption → Unsuitable for WSNs

Embedded Systems 93 Operating Systems

---

---

---

---

---

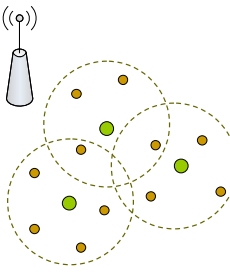

---

---

---

**LEACH**

- **Low Energy Adaptive Clustering Hierarchy**
  - nodes organized in clusters
  - a cluster-head within each cluster
    - ▶ distributed cluster-head election algorithm
  - each node selects the cluster-head minimizing the energy needed for communications
  - cluster-heads forward messages to the sink
    - ▶ TDMA schedule for communications
- cluster-head rotation
  - ▶ for uniform distribution of energy consumption

W. R. Heinzelman, A. Chandrakasan, and H. Balakrishnan, Energy-Efficient Communication Protocol for Wireless Microsensor Networks, Proc. Hawaii International Conference on System Sciences, January, 2000. 94

---

---

---

---

---

---

---

---

---

**MintRoute**

- Tree building and routing protocol (TinyOS)
  - designed for periodic data collection
- Focus on real-world problems
  - dynamic environments
    - ▶ nodes joins and leaves can be frequent
    - ▶ non-ideal channel
  - link connectivity
    - ▶ very unstable
    - ▶ efficient link estimation algorithm
  - neighbor management
    - ▶ low storage requirements
    - ▶ scalable
  - reliable routing

A. Woo, T. Tong, and D. Culler, Taming the underlying challenges of reliable multihop routing in sensor networks, Proc. ACM SenSys 03, pp: 14-27, Los Angeles, CA, November 2003
